Replacement server should be ready to go in the next week or two BTW

I ordered 128GB of RAM for it, and an SSD to put the databases and mailman on

👍 1 😊⁺

It's 5 years old (current server is now 12) but the CPU should still be about 40% faster than the older prior model

With more cores

FYI I still haven't had any time to spec out and really get a good new server with the best price for us. The 5-year-old server that Chris Sanders donated to us is still a significant improvement in every way over our current one and it's sitting in my lab right now.

So I'm going to spend $500 on parts to upgrade it, install it, and use that to replace mickaboo for now.

Then when I get a breather between work and class I can start trying to spec out a re long-term replacement
